

Mini cranes

Galizia

Galizia's new 2t capacity GK20 is its tracked version of the G20 electric pedestrian crane, as requested by GGR Group. The GK20 measures 820mm wide when the tracks are closed, allowing it to pass through standard doorways, and opens to 1,220mm for increased stability during operation. It also measures 2,240mm long by 1,700mm tall. This new version will be used where it is important to distribute the load, reduce the pressure on the ground and fit through small doorways, such as in glass and steel lifting, explained managing director Fabio Galizia-Vercelli.

For more precise and gradual movements, it has a 48 volt battery with "two compact brushless AC motor drives controlled by two AC electronic systems," he says. Both drive and boom functions use full proportional radio remote controls, and a load limiting device with display is included.

Galizia has also updated its 20t capacity GF200 electric crane to include a new dual front electric motor drive concept. For the two pairs of front wheels, each is controlled by its own electric motor for extra manoeuvrability.

Galizia's GK20A, the tracked version of the 2t capacity Galizia G20, can pass through standard doorways at 820mm with its tracks closed.

Galizia's 20t capacity GF200 has two electric motors, one to separately control each pair of front wheels.
